ABSTRACT OF THE DISCLOSURE

A weatherized posting board assembly having a back frame and front cover of unitary construction, the interior surfaces of the back frame and front cover defining an enclosure within which documents or the like may be posted on a removable posting board. The front cover is hingedly attached to the back frame by a pair of hinge pins having a plurality of compressible ribs. The front cover includes a recess sized to receive a locking mechanism, the recess serving to inhibit tampering with the lock as well as protect the lock from the effects of the elements. The interior sidewalls of the back frame include a plurality of snap projections for releasable locking engagement with the edges of the posting board. A rectangular mounting brace projects from the rear exterior surface of the back frame generally adjacent to the perimeter of the rear surface. The mounting brace is adaptable for connection to either a post or any convenient vertical surface.
